

Hostile Environments

Individual Needs

In always meeting the changing needs of our customers, CPS has developed a line of control buildings and equipment shelters. Durable, weatherproof, climate controlled, pressurized and structurally strong units are the features being engineered to suit your individual hostile environment applications.

Control Room

When your operating personnel needs unobstructed visibility, safety glazed windows can be installed in the wall panels. CPS can also slope the glazing windows to reduce glare and reflection. Insulated safety glass is an available option.

Weather Monitoring Station

Portables built like they were meant to be permanent. At CPS, we build portable structures for the longest life with the least maintenance. Using the latest in Computer Aided Design, the structure is planned down to the finest detail – with walls, windows and doors – that fit precisely.

Contain Protect Shelter

Heavy Duty Structure

A welded steel frame can be constructed, by sections, to meet any size requirement your company may have. Steel floor & roof joists, steel studs, and steel decking are features that provide extra protection for employees or equipment. All in all, you cannot buy a better safety unit than a CPS welded steel building.

Operators Pulpit

If the job calls for it, CPS portable plant offices can be fire-rated or built entirely of non-combustible materials... with a steel frame, steel cladding inside and out, steel window frames and reinforced safety glass. For extra protection, Class 1 explosion proof electronics are available as an option.

Equipment Shelters

Safety and equipment protection are why equipment shelters are needed. In our on-going quest to meet the industry shelter requirements, CPS has developed a line of Control Buildings and Equipment Shelters. These structures are durable, weatherproof, climate controlled, messurized and structurally strong.
